

## Swing Carriages

Swing Carriage - The load capacity of a forklift jib has a most of approximately 1935 pounds up to 6000 pounds on either the extended or retracted positions range. You may need to check with a material handling specialist concerning the specific limits of your forklift application. The load capacity ratings are intended for the jib itself and not the lift truck or even the maximum load that can be carried securely using a particular lift truck. It is very important keep in mind that at any time when any accessories like a forklift jib are attached to the forklift, the new center of gravity made by the attachment would decrease the overall lift capacity of the forklift. There are directions available that offer details on the way to correctly gauge these load limits.

Before utilizing whatever lift truck jib, be sure that the shackles and hooks are correctly secured to the lift truck. Verify and even double check that the pins are tight. It is very important that the weight calculations have been correctly done and double checked. Bear in mind to consider the fact that rated capacities occasionally decrease whenever the boom is in a raised position, each time the boom is fully extended with telehandlers or whenever the mast is slanted forward.

Important pointers when making use of an adjustable jib is not to ever pull a load with this sort of attachment. These types of attachments are really just designed for vertical lifting. What's more, refrain from letting the load sway. Use extreme caution every time a load is carried to be able to avoid tipping over the truck.
